

Project Title:

Smart Medical Lab Test Booking, Report & Follow-up Management System

1. Problem Statement

- Existing laboratory systems mainly provide test booking and reports. Patients often find it difficult to track sample status, manage previous reports, compare test results, remember follow-up dates, and schedule future tests.
- This project aims to provide a single patient-centric platform that connects lab test booking, sample tracking, digital reports, result comparison, and follow-up management in one workflow.

2. Objectives

- To provide easy lab test booking with lab visit or home sample collection options.
- To track sample collection and testing status.
- To manage digital reports and compare previous test results.
- To provide follow-up reminders and future test booking.
- To help laboratories manage tests, slots, bookings, and reports efficiently.

3. Scope

The system supports two users:

Patient:

- Register and book laboratory tests.
- Select collection method and available slots.
- Track sample status.
- View reports, compare results, and manage follow-ups.

Lab Admin/Staff:

- Manage tests, prices, slots, bookings, sample status, and reports.

The system focuses on laboratory service management and does not provide medical diagnosis.

4. Expected Outcome

- A centralized platform for patients and laboratories.
- Improved tracking of tests, reports, and follow-up activities.
- Better management of laboratory operations and patient records.
